EDUCATION

University of California, San Diego (UCSD) **Sep 2024 – Jun 2028**
B.S. Computer Engineering *GPA: 4.0/4.0*

Awards/Honors: Provost Honors, Dean's List

Relevant Coursework: Data Structures & Algorithms, Systems Programming, Computer Architecture & Organization, Linear Algebra, Discrete Math, Probability & Statistics, Graph Theory

EXPERIENCE

Uber | *Software Engineer Intern, GPU Compute Kubernetes* Sep 2026 – Dec 2026

- Cut GPU quota change turnaround from ∼2 days to under 2 minutes and self-served 95% of requests by building a Go/Cobra CLI and gRPC backend to manage Kubernetes ConfigMaps governing ∼1,500 GPUs across 20 shared Ray resource pools.
- Achieved 100% authenticated and audit-logged quota mutations for 20 teams by integrating SSO/IAM authorization, hierarchical resource-pool policies, and rollbackable change history without exposing cluster credentials.
- Eliminated 10 malformed/drift incidents per quarter by building multi-layer validation with SKU-derived quotas, consumer-parser checks, Kubernetes Server-Side Apply conflict detection, and dry-run diffs.

Salesforce | *Software Engineer Intern* Jun 2026 – Sep 2026

- Built synchronous and asynchronous multi-tenant Python storage clients that abstract AWS S3 and Google Cloud Storage behind a cloud-agnostic API; separated tenant resolution, cloud routing, and SDK I/O, reducing integration boilerplate across 5+ core services.
- Engineered configurable retry and circuit-breaker policies for storage operations, reducing unrecovered transient failures by 90% while keeping p99 retry latency below 2.5 seconds.
- Designed tenant-isolated credential resolution backed by mTLS service identity and single-flight caching, enforcing per-tenant credential boundaries while reducing redundant authentication calls by 95%.
- Deployed a containerized FastAPI service to Kubernetes with Terraform and Helm; validated 26 storage operations through integration tests and instrumented SLO telemetry with OpenTelemetry and Prometheus.

Existential Robotics Laboratory (ERL) @ UCSD | *Undergraduate Robotics Researcher* Dec 2025 – May 2026

- Implementing LiDAR-based SLAM and autonomous motion-planning algorithms in Python using ROS, Gazebo, and PyBullet for simulated robotic navigation.

Forsys Inc | *Software Engineer Intern* May 2024 – Sep 2024

- Developed a Python LLM assistant that converted natural-language questions into Salesforce API queries, reducing manual CRM lookups by 90% and increasing team productivity by 30%.
- Built a Salesforce-to-PostgreSQL ETL pipeline with batched loads, indexing, and automated health checks, reducing query latency from minutes to seconds.

PROJECTS

JarvisOS [GitHub] | *Python, AI Models (local/cloud), OpenTelemetry, SQLite* Jul 2026

- Built JarvisOS, a terminal-first Python orchestration runtime that converts natural-language goals into validated workflows across local/cloud models, MCP integrations including Google Calendar and Gmail, and local plugins.
- Optimized workflow execution through direct-request short-circuiting, lazy MCP-server activation, session reuse, and bounded graph concurrency, cutting end-to-end latency by 40–75% across tool-driven workloads.
- Implemented SQLite-backed state for tasks, approvals, and execution traces, with structured logging, OpenTelemetry tracing, and Prometheus metrics for latency and reliability monitoring.

CompressBench [GitHub] | *C++, Go, AWS, Compression Algorithms, Binary I/O, REST APIs* Apr 2026

- Developed a modular C++ compression benchmarking platform using bit-level streams, binary serialization, custom file headers, and extensible codec interfaces for lossless compression across text, binary, and raw image formats.
- Built a Go REST backend for compression and verification workflows; benchmarked 100+ files, reaching up to 65% space savings and 50+ MB/s throughput with CI/CD validation.

Val Gazer [GitHub] | *Python, OpenCV, MediaPipe, Scikit-learn, JavaScript, Overwolf API* May 2025

- Built a Python gaze-tracking system using OpenCV and MediaPipe to extract 468 facial landmarks at 30 FPS; trained a random forest regressor on 5K+ calibration samples, achieving 97% accuracy in mapping gaze coordinates to on-screen positions.
- Integrated the Python service with the Overwolf Game Events API via WebSocket to react to real-time Valorant events, processing 200+ events per match.

SKILLS

Languages: Python, Java, C++, Go, SQL, Bash
Infrastructure & Data: Linux, Docker, Kubernetes, AWS, GCP, PostgreSQL, SQLite, Redis, Terraform, Helm
Frameworks & Tools: FastAPI, OpenTelemetry, Prometheus, ROS, Gazebo, PyBullet, Git/GitHub, Bazel, Jenkins, Claude, Codex
Systems: Distributed Systems, Cloud Storage, API Design, ETL Pipelines, Concurrency, Observability, Binary I/O, Control Systems, Computer Vision
